

I've Been Everywhere, Man

Alice travels a lot for her work. Each time she travels, she visits a single city before returning home.

Someone recently asked her “how many different cities have you visited for work?” Thankfully Alice has kept a log of her trips. Help Alice figure out the number of cities she has visited at least once.

Input

The first line of input contains a single positive integer $T \leq 50$ indicating the number of test cases. The first line of each test case also contains a single positive integer n indicating the number of work trips Alice has taken so far. The following n lines describe these trips. The i th such line simply contains the name of the city Alice visited on her i th trip.

Alice's work only sends her to cities with *simple* names: city names only contain lowercase letters, have at least one letter, and do not contain spaces.

The number of trips is at most 100 and no city name contains more than 20 characters.

Output

For each test case, simply output a single line containing a single integer that is the number of distinct cities that Alice has visited on her work trips.

Sample Input 1

```
2
7
saskatoon
toronto
winnipeg
toronto
vancouver
saskatoon
toronto
3
edmonton
edmonton
edmonton
```

Sample Output 1

```
4
1
```

```

import sys #imported the sys library to exit the program when need be
testcases= int(input()) #declared a variable to recieve the testcases
if testcases >50: #declared a constraint
    sys.exit()
else:
    while testcases != 0: #used a while loop to loop through to go through testcases
        hypo_trips =int(input()) #declared a variable to recieve number of trips (hypothetical)
        if (hypo_trips > 100): #declared a constraint
            sys.exit()
        else:
            triplist = [] #declared a list for the trips
            while hypo_trips != 0: #used a while loop to go through the trips
                triplist.append(str(input())) #appended each trip to the list
                hypo_trips-=1 #subtracted 1 everytime went through the loop so that the loop wouldnt go on forever
            x = set(triplist) #declared variable so that i can use the set function to get distinct strings in the list
            count=0
            for i in x: #used a for loop to go through the list and get a count
                count+=1
            testcases-=1
            print(count)

```
